

Sonokote™

Acoustically Transparent Paint

SonoKote

SonoKote by ROMABIO is an acoustically-transparent, non-bridging paint for acoustic panels and other surfaces. It works as a new panel finish or as a retro-paint finish for existing acoustic panels, enabling a wide range of color choices for materials like our Poly Max, PEPP, CFAB panels or other acoustically-absorbent materials.

SonoKote is a biological or mineral paint that has a crystalline structure that creates a bond with the surface. This crystalline shape is similar to that of a honeycomb, a natural molecular shape that allows the mineral paint to breathe.

A breathable paint layer is important because it permits moisture and air, as well as sound, to move more freely in a closed environment. This acoustically transparent paint creates a more durable paint finish and a mold-resistant system, while also allowing sound energy to pass through the paint to the sound-absorbent materials behind the paint layer.
